AB Claimed diffusion transfer type color photog. material has, on a substrate, ³3 light-sensitive layers contg. Ag halide emulsion, dye donor and the binder, where a dispersion of oil-sol. dye and fine particles of inorg. colored solid is incorporated in ³1 of the light-sensitive and/or light-insensitive layer. The material is spectrally sensitive at least in 750-790 and 800-850 nm, and the colored interlayer has the absorbance in 720-780 nm. It has an improved color discrimination, color balance and uniformity of dye d., and is suitable for color scanner purposes using a laser diode as the imaging light source. Suitable dyes are di- or tricarbocyanines and indoaniline dyes. Thus, a multilayer donor film of a dye diffusion transfer material was provided an interlayer contg. aq. dispersions of fine carbon black particles (0.02 mm) and 1,1,1',1'-tetramethyl-3,3'-di-n-butyl-6,6'-di-tetrafluoroboronylbenzo-tricarbocyanine in gelatin to provide the mentioned advantages.

AB . . . electrophotog. toner is characterized by contg. an IR-absorbing dye which is localized close to the toner surface and has a particle size ratio to the toner particle of 0.001-0.2. The toner is manuf. by a method selected from (1) adding an IR absorber dispersed in a medium. . . agent with an IR absorber and treating the toner with the exterior treating agent, (5) dispersing and expanding the toner particle in a soln. contg. an IR absorber, and (6) adding an IR absorber in the monomer compn. forming the toner particle.
